

# AO Series – Industrial Air Cooled Copper Tube/Aluminum Fins

0922

The Industrial AO Series features an AC fan drive and is ideal for medium flow rates and moderate heat removal. This series is available with an optional internal pressure bypass. Cabinet louvers allow the user to regulate the direction of heated exhaust air. This versatile design allows for a one or two pass configuration.

TTP's XSelector sizing program can be used to help optimize the sizing of the cooler for better performance and value.

## How to Order

### Model Series

**AO**  
**AOR** - with Bypass

### Model Size Selected

**5, 10, 15, 20, 25, 30, 35, 40**  
(See Performance Curve Charts on page 2 for sizes or **XSelector**\* sizing program)

### Number of Passes\*

**Blank** - No Bypass  
**1** - One Pass  
**2** - Two Pass  
ADD FOR **AOR** MODELS ONLY: Number of passes

### Connection Type

**Blank** - NPT  
**S** - SAE  
**M** - Metric

### Bypass Setting\*

**Blank** - No Bypass  
**30** - 30 PSI  
**60** - 60 PSI  
ADD FOR **AOR** MODELS ONLY: Bypass setting  
This is a partial flow pressure bypass only.  
It is not designed to be a full flow system bypass.

### Foot Mounted Brackets

**Blank** - No Brackets  
**FB** - Foot Brackets

### Specify Motor Required

**1PH** - Single Phase  
**1PH EXP** - Single Phase Expl. Proof  
**3PH** - Three Phase  
**575V** - Three Phase 575 Volt  
**3PH EXP** - Three Phase Expl. Proof  
**NM** - No Motor

\* To register for **XSelector** please go to [www.thermaltransfer.com/get-in-touch/](http://www.thermaltransfer.com/get-in-touch/) and complete the **XSelector** Inquiry form and submit.

Download the **XSelector** for both Apple and Android formats by searching for **XSelector** in their App Stores. You must first register for **XSelector** before using it on mobile devices.

## Options

Internal pressure bypass

Foot brackets

SAE & metric connections

Corrosive resistant marine coating

## Ratings

Maximum Operating Pressure 300 PSI

Test Pressure 300 PSI

Maximum Operating Temperature 400°F

## Materials

Tubes Copper

Fins Aluminum

Turbulators Steel

Fan Blade Aluminum with steel hub

Fan Guard Zinc plated steel

Cabinet Steel with powder coat finish

Manifolds Steel

Connections Steel

## Piping Diagram

### AO - One Pass

### AO - Two Pass

### AOR - One Pass with Bypass

### AOR - Two Pass with Bypass

# Performance Curves

For additional sizing information consider using TTP's **XSelector** online sizing Program.\*

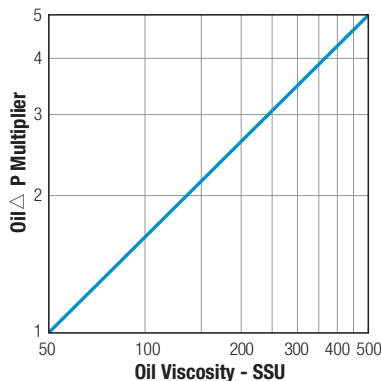

## One Pass Oil

## Two Pass Oil

## Oil Pressure Correction

# Selection Procedure

Performance Curves are based on 50SSU oil leaving the cooler 40°F higher than the ambient air temperature used for cooling. This is also referred to as a 40°F approach temperature.

**STEP 1 Determine the Heat Load.** This will vary with different systems, but typically coolers are sized to remove 25 to 50% of the input nameplate horsepower.

(Example: 100 HP Power Unit x .33 = 33 HP Heat load.)

$$\text{If BTU/HR is known: } \text{HP} = \frac{\text{BTU/HR}}{2545}$$

**STEP 2 Determine Approach Temperature.** Desired oil leaving cooler °F – Ambient air temp. °F = Actual Approach

**STEP 3 Determine Curve Horsepower Heat Load.** Enter the information from above:

$$\text{Horsepower heat load} \times \frac{40 \times \text{Cv}^1}{\text{Actual Approach}} = \text{Curve Horsepower}$$

**STEP 4 Enter curves** at oil flow through cooler and curve horsepower.

Any curve above the intersecting point will work.

**STEP 5 Determine Oil Pressure Drop from Curves:**

l = 5 PSI n = 10 PSI s = 14 PSI = 20 PSI Multiply pressure drop from curve by correction factor found in oil ΔP correction curve.

<sup>1</sup> Cv correction chart found on page 4.

## Desired Reservoir Temperature

**Return Line Cooling:** Desired temperature is the oil temperature leaving the cooler. This will be the same temperature that will be found in the reservoir.

**Off-Line Recirculation Cooling Loop:** Desired temperature is the oil temperature entering the cooler. In this case, the oil temperature change must be determined so that the actual oil leaving temperature can be found. Calculate the oil temperature change (oil ΔT) with this formula:

$$\text{Oil } \Delta T = (\text{BTU's/HR}) / (\text{GPM Oil Flow} \times 210).$$

To calculate the oil leaving temperature from the cooler, use this formula:

$$\text{Oil Leaving Temp.} = \text{Oil Entering Temp.} - \text{Oil } \Delta T.$$

This formula may also be used in any application where the only temperature available is the entering oil temperature.

**Oil Pressure Drop:** Most systems can tolerate a pressure drop through the heat exchanger of 20 to 30 PSI. Excessive pressure drop should be avoided. Care should be taken to limit pressure drop to 5 PSI or less for case drain applications where high back pressure may damage the pump shaft seals.

## Oil Temperature

Typical operating temperature ranges are:

Hydraulic Motor Oil	110° - 130°F
Hydrostatic Drive Oil	130° - 180°F
Bearing Lube Oil	120° - 160°F
Lube Oil Circuits	110° - 130°F

## Lubrication Notes

**Caution:** Do not over oil or over grease. **Ball bearings** – No grease needed at start up. Grease as follows:

5,000 Hours/Year	5 Year Grease Interval
Continuous — Normal Applications	2 Years
Seasonal Service — Motor is idle for 6 months or more	1 Year
Continuous — High ambients, dirty or moist locations, high vibration	6 Months
